The Do Not Remove WHEAT SITUATION

FOR RELEASE
DEC. 7, A. M.

*In this issue:
The Rice Situation and Outlook*

WS-136 OCT.-DEC. 1953

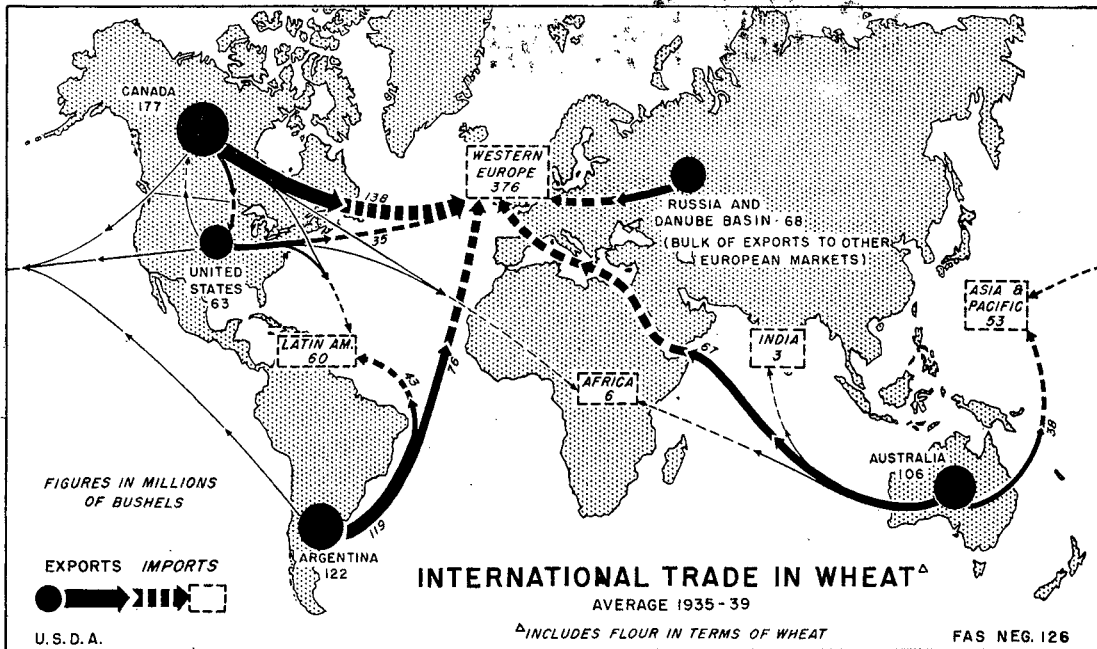

For many years the United States, Canada, Australia, and Argentina have been the only countries consistently exporting large quantities of wheat. Their total exports of about 840 million bushels in 1952-53 were below the postwar peak of 955 million bushels in 1951-52 but greatly above the prewar average. Most moves as grain, but the propor-

tion of flour has increased over pre-war.

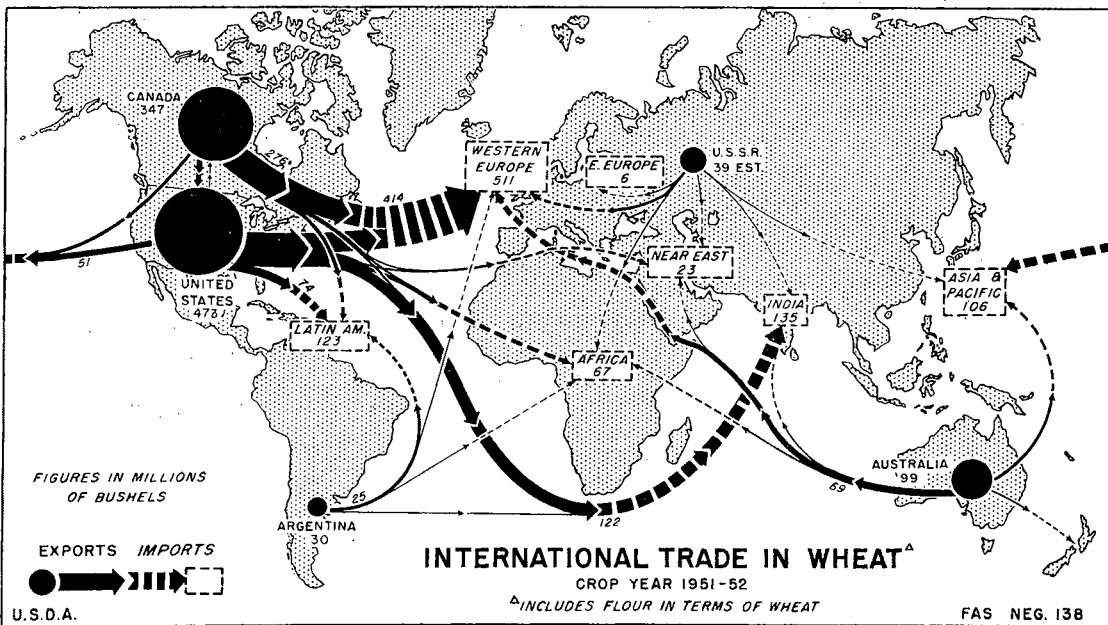

Total 1952-53 exports of wheat and flour were lower than in 1951-52, mainly because of much smaller United States exports. Canadian exports increased 45 million bushels, while Argentina and Australia shipped about the same quantities as a year earlier.

UNITED STATES DEPARTMENT OF AGRICULTURE
AGRICULTURAL MARKETING SERVICE

During 1935-39 Canada was the leading exporter, followed by Argentina, Australia, and the Soviet Union and Danube Basin countries. United States exports averaged only 63 million bushels, including flour milled from Canadian wheat.

Western European countries were the leading importers. Substantial quantities also moved to deficit producing countries in the Latin American and Caribbean area, and in Asia.

Most of the wheat exported during 1951-52 found a market in the deficit-producing countries of Western Europe.

World wheat trade in 1951-52 changed considerably from prewar. The United States was the leader, with 473 million bushels, but in 1935-39 it ranked fifth among exporting areas. Exports from Canada were also larger than prewar, but those from Argentina, Australia, and Russia were smaller.

In 1952-53 world exports totaled about 915 million bushels.

Canada, with 392 million bushels replaced the United States with 317 million as the largest exporter. In 1953-54, total world exports are expected to be down about 10 percent, with decreases in both the United States and Canada. Exports from Australia may be about the same as the 100 million in 1952-53, but those from Argentina much larger than the 30 million in 1952-53, following the crop failure of that year. All other countries are expected again to contribute about 100 million bushels.

THE WHEAT SITUATION
Including Rice

Approved by the Outlook and Situation Board, November 30, 1953

SUMMARY

The world crops of wheat and rice in 1953 are both substantially above average. Wheat crops in importing countries are generally above a year ago and United States exports in the first 5 months of the 1953-54 marketing year totaled about 90 million bushels compared with 125 million in the same period last year. World rice production is about equal to the record of last year, but the crop in Japan, second to Cuba as the largest importer of United States rice, was very small and that country will need large imports. The United States share will depend upon how United States prices compare with those for Oriental supplies.

World wheat production this year is forecast by the Foreign Agricultural Service at about 7 billion bushels, 4 percent below the record crop in 1952, but 20 percent above the 1945-49 average. The decline from a year ago is accounted for mainly by smaller crops in the principal exporting countries--The United States, Canada, Argentina, and Australia. The 1953 wheat crop of nearly 1.3 billion bushels in Western Europe--the main world deficit area--is above a year ago, and exceeds the 1945-49 postwar average by about 325 million bushels.

Although production is down in the principal exporting countries, carryover in these countries totaled over 1.2 billion bushels--almost double the level of July 1, 1952. In North America, the total supply for the United States is a record and that of Canada a near-record.

The United States wheat supply for the marketing year beginning July 1, 1953 is estimated at 1,730 million bushels. This consists of the carryover July 1, 1953 of 562 million bushels, the crop estimated as of November 1 at 1,163 million, and imports of possibly 5 million bushels, mostly of feeding quality grain. This would be 8 percent above the previous record of 1,601 million bushels in 1942-43. Domestic disappearance for 1953-54 is estimated at about 700 million bushels. With total supplies estimated at 1,730 million bushels, this would leave 1,030 million bushels for export in the marketing year and carryover July 1, 1954.

In an effort to expand wheat exports outside the International Wheat Agreement, the Department announced on November 19, effective immediately, that the Commodity Credit Corporation is offering to sell to the regular export trade a limited quantity of CCC-owned wheat for export. This would be in addition to wheat moving under the Agreement program. Prices f.o.b., specified ports, will be announced at the same time each day that Agreement prices are announced by the USDA. The price per bushel will not be less than the Wheat Agreement price. CCC wheat also will be made available for export as flour.

Wheat prices have advanced 5 to 20 cents since late September. Some further advance, with minor interruptions, is expected, reflecting the effect of the price support programs. The total quantity owned by CCC and under loan and purchase agreement is likely to be so large that quantities available in the market may be short of requirements for domestic use and exports. Accordingly, prices are expected to advance to above loan levels, which would encourage farmers to sell wheat covered by purchase agreements, and to redeem and sell wheat under loan. Wheat prices are still generally below the loan level after allowing for storage. However, some high protein hard winter and spring wheats are above the net loan, and the price of Hard Amber Durum is substantially above.

The national acreage allotment for 1954 is 62 million acres. It is likely the allotment will be exceeded slightly, as a result of increases by some small producers who are not interested in taking advantage of the price support programs. Farmers can plant up to 15 acres without being affected by marketing quotas. The first estimate of winter wheat production for 1954 will be issued December 21. Domestic requirements for the 1954 crop are estimated at about 700 million bushels.

World rice production, according to present information, is estimated at 359 billion pounds of rough rice. This exceeds slightly last year's record crop and is 10 percent above the 1945-49 average and 7 percent above the 1935-39 average. Rice acreages were expanded in many areas of the world, and in most of the countries larger crops than last year are either being harvested or are in prospect.

United States rice supplies for the 1953-54 marketing year, in terms of milled rice excluding brewers', total 35.3 million cwt., which exceeds the previous record in 1951-52 by 6 percent. [Unless our exports are again very large, we will have a substantial increase in carryover stocks. Earlier this year we had export quotas, largely to assure that military supplies would be available. However, with the turn of events in Korea these requirements are now sharply reduced and export controls have been removed.] Announcement regarding acreage allotments and marketing quotas must be made by December 31. It would appear from information now available that marketing quotas will not be necessary but that acreage allotments may be proclaimed.

The Domestic Rice Situation

Wheat Supplies Exceed Previous
Record by 8 Percent

Total wheat supplies for the marketing year beginning July 1, 1953 are estimated at 1,730 million bushels. This consists of the carryover July 1, 1953 of 562 million bushels (revised from 559 million), the crop estimated as of November 1 at 1,163 million, and imports of possibly 5 million bushels, mostly of feeding quality grain. The supply is 8 percent above the previous record of 1,601 million bushels in 1942-43, and 10 percent above the 1,569 million bushels of 1952-53. (table 2).

Domestic disappearance for 1953-54 is estimated at about 700 million bushels, slightly more than the 690 million of 1952-53. Civilian and military food use (including use by Territories of the United States) is expected to be about 500 million bushels, slightly above 1952-53. Feed use may be about 120 million, compared with about 110 million in 1952-53. About 80 million bushels may be used as seed.

Exports July through November totaled about 90 million bushels ^{1/}, which included about 23 million bushels to Pakistan of the 26 million bushels currently programmed for that country under the Emergency Assistance Act. The rate of exports so far this year indicates that exports for the 1953-54 marketing year will be substantially below the 317 million bushels exported in 1952-53.

Wheat Production 129 Million Bushels Below 1952;
Quality Generally Good

Wheat production in 1953 was estimated at 1,163 million bushels in the November Crop report. This is 128 million bushels smaller than the 1952 crop but is 75 million more than the 10-year average. The indicated yield of all wheat was 14.8 bushels per seeded acre compared with 16.7 bushels a year earlier and the 1942-51 average of 15.5. Production of wheat by classes in 1953, in million bushels, with comparable figures for 1952 in parenthesis, was as follows: Hard red winter 497 (712); soft red winter 236 (197); hard red spring 219 (182); durum 14.2 (22.0); and white 197 (178). Table 8 shows the estimated supply and distribution by classes, 1941 to date. Because of revisions, figures for the last two years differ from those published in the July-September issue.

The 1953 wheat crop was harvested under nearly ideal conditions and is low in moisture and generally of good quality. The quality of the winter wheat crop, based on inspected receipts at Kansas City, is below the excellent 1952 crop but about equal to the average. Although the proportion grading No. 1 this year was smaller than average, the proportion grading No. 2 or better was larger than average. Of the inspected receipts during July through September, 32 percent graded No. 1 this year compared with 53 percent last year and 39 percent, the 10-year average. The percent grading No. 2 or better was 81 percent this year, 88 percent last year, and 75 percent, the 10-year average. The spring wheat crop is of excellent milling quality. However, reflecting the rust damage in the Dakotas, the average test weight is relatively low. The protein content of the spring wheat crop is lower than last year and slightly below average. The quality of the wheat crop in Montana is excellent both as to test weight and protein.

October 1 Stocks Largest of Record for Date:
July-September Disappearance Smallest Since 1941

Stocks of wheat in all positions on October 1 were the largest of record for that date and totaled 1,539 million bushels. These compare with 1,345 million a year earlier and 1,372 million on October 1, 1942, the previous record. Farm stocks were the third largest of record and totaled 562 million bushels, compared with 511 million bushels a year earlier, and 532 million, the 10-year average. Stocks in off-farm positions totaled 977 million bushels, compared with 834 a year earlier and 647 on October 1, 1951. Quantities in the various positions in 1953 and other recent years are shown in table 7.

^{1/} Sales under the International Wheat Agreement, August through November 24, totaled 47.9 million bushels, as against 115.5 million for the same period a year earlier. The U. S. quota for the year is 210 million bushels.

Disappearance of wheat from July through September this year was the smallest since 1941. This reflected the reduction in exports, which totaled only 68 million bushels compared with 73 million a year earlier and 111 million two years ago. Food use was 126 million, the same as the average of the two previous years, and seed was down slightly, reflecting fewer acres. Wheat feeding was probably light. 2/

Cash Wheat Prices Expected
to Continue to Advance

Wheat prices have advanced 5 to 20 cents since late September. Some further advance, with minor interruptions, is expected, reflecting large quantities of wheat going under the price support programs. Through October 15, about 350 million bushels of 1953 crop wheat were placed under support programs, compared with 312 million bushels for the same period a year earlier. With farmers having until January 31 to take advantage of these programs, it is possible that about the same quantity will be placed under support this year as the 460 million last year, even though the crop is 10 percent smaller. In mid-November the CCC owned 427 million bushels of wheat from previous harvests. Construction of new elevator storage facilities under a recently announced occupancy guarantee program will lend effectiveness to the support programs.

With 777 million bushels already in the CCC inventory or under loan or purchase agreement, the "free" market supply for 1953-54 is down to 953 million bushels. This is not enough to provide for approximately one billion bushels needed for domestic disappearance, exports and operating stocks at the year's end to take care of mill inventories, transit supplies, etc. Accordingly, it appears that prices are likely to advance enough to encourage farmers to sell wheat covered by purchase agreements, or to redeem and sell wheat under loan.

On November 30 the price of No. 2 Hard Winter Wheat at Kansas City, ordinary protein, was \$2.30, 12 cents under the effective loan rate after allowing for storage charges of 7 cents per bushel. At the same time, the price of No. 2 Soft Red Winter at St. Louis, reflecting very large supplies of this class of wheat, was \$2.04 or 42 cents below the effective loan. The price of No. 1 Dark Northern Spring, ordinary protein, at Minneapolis was \$2.36, 9 cents below the effective loan. Some high protein hard winter and spring wheats are above the net loan after charges. The price of No. 2 Hard Amber Durum at Minneapolis on November 30 was \$3.67, reflecting a very short supply of this class of wheat. This market price was \$1.23 above the effective loan.

2/ The sum of the accountable disappearance exceeds that shown by current estimates of supplies, including July 1 stocks, production, and imports. This discrepancy occurred in 1951 and 1952, but disappeared as the season progressed and the possibility of duplication between stocks reported for the various positions was reduced.

The 1954 Wheat Outlook

The national acreage allotment for 1954 is 62 million acres. It is likely the allotment will be exceeded slightly, as a result of increases by some small producers who are not interested in taking advantage of the price support programs. Farmers can plant up to 15 acres without being affected by marketing quotas. The first estimate of winter wheat production for 1954 will be issued December 21. Domestic requirements for the 1954 crop are estimated at about 700 million bushels.

The national average support price for the 1954 crop was announced on October 8 at not less than \$2.20 a bushel. This is 90 percent of the August 15, 1953 wheat parity price of \$2.45. Support for 1953-crop wheat, now eligible for loan and purchase agreement, is a national average of \$2.21 a bushel. If the wheat parity price as of July 1, 1954 (the beginning of the marketing year for the 1954 crop) is higher, the support level will be increased to reflect 90 percent of the wheat parity price at that time. In no event will the support be lower than the announced \$2.20 national average. To be eligible for wheat price support in 1954, a producer must (1) be in compliance with his 1954 wheat acreage allotment for the farm, but not other 1954 allotments for basic commodities ^{3/}, and (2) obtain wheat marketing cards for all farms in the county on which he has an interest in the wheat crop.

THE WORLD EXPORT SITUATION AND OUTLOOK ^{4/}

The Current Export Outlook

One of Continued Readjustment

The outlook for United States wheat in foreign markets during the current marketing season is one of continuing readjustment from the all-time record world trade in wheat and flour, of which the United States contributed nearly half. It is a readjustment in total trade one might expect in a world not engaged in war, and to a smaller share of that trade by the United States.

Total world trade in wheat and flour in 1952-53 was close to the postwar average of 900 million bushels. However, in that year many significant developments in the wheat trade took place, which affected the United States. These included: (1) A record world wheat crop was harvested in 1952, and reserves were on the increase--in many countries

^{3/} The Department announced on November 13 that a previously announced requirement that producers must be in compliance with all basic agricultural commodity acreage allotments established for their farms, in order to be eligible for price support on any one basic commodity, would not be put into effect for crops produced in 1954.

^{4/} Adapted from a statement on "Foreign Markets for American Wheat" by R. L. Gastineau, presented at the Annual Agricultural Outlook Conference, October 28, 1953.

from a low level of carryover stocks. As a result many countries for the first time in the postwar period no longer depended entirely on current production to meet their requirements. (2) Argentina came back as one of the principal wheat exporters. (3) The International Wheat Agreement was renewed with significant revisions in quantities and in the price range. (4) The negotiation of a truce in Korea and some easing in international tensions took place.

World Trade In Postwar Period
Reached All-Time High

Total world trade in wheat during the 7 marketing years from 1945-46 through 1951-52 averaged slightly over 900 million bushels. For individual years of that period, the total ranged from a low of 760 million bushels in 1946-47 to an all-time high of over 1 billion in 1951-52.

Western Europe was the principal market--taking, on the average, about 60 percent of the total. Asia was next in importance with 20 percent, followed by the Western Hemisphere with 15 percent, and Africa with the remaining 5 percent.

The earlier postwar years were characterized by the critical food shortages that accompany the dislocations of war. They were also characterized, of course, by sweeping political and economic changes that resulted in some fundamental shifts in the supply-demand relationships for wheat. Formerly important sources of supply for grain in Eastern Europe and the Danube Basin were moved behind the Iron Curtain and lost much of their importance as surplus producers. Population increases in Asia, and a sharp decline in the level of world rice trade (again an aftermath of war in the Pacific) brought increased requirements for wheat in that area.

There are other changes--less striking, perhaps--that could be mentioned. Argentina, for example, lost much importance as a wheat exporter during this period as a result of its industrialization program. Only in recent years has there been a shift in emphasis back to a policy of increased production of grain in that country.

The postwar period has been described as one of abnormally high world import requirements for wheat. Looking back on developments and changes which have taken place during the past 8 years, it now appears that some of the increased requirements may have become more or less permanent. This factor has real significance for the United States wheat industry.

United States Postwar Exports
Almost Half of World Trade

The importance of the United States as a source of supply for wheat and wheat flour in postwar world trade has been noted many times in recent years. By the end of June, 1952, our total exports for the 7 years beginning July, 1945, had reached 2.9 billion bushels--an annual average of about 415 million bushels--or 46 percent of the total world trade in wheat and flour during that period.

The 7-year period is replete with records for the United States--195 million bushels of wheat exported in the form of flour during 1946-47; nearly 60 million bushels total wheat and flour in a single month (April 1951); more than 26 million bushels of wheat as flour in a single month (May 1947). The all-time peak was reached in 1948-49, when total wheat and flour exports for that year reached 503 million bushels. This was the largest total ever moved in a single year by one exporting country. Our wheat and flour exports during that year exceeded domestic consumption of wheat for food in the United States by more than 20 million bushels. Wheat exports by the U. S., 1939 to date are shown in table 5.

Many food-deficit countries throughout the world looked to the United States as a source of supply for wheat and flour during the postwar period. Some countries, such as France, India, and Brazil, for example, were "in and out," with fairly heavy requirements during some years of the 7-year period. But for the entire period, Western Germany was by far the largest outlet, taking an average of 87 million bushels. Japan was next, with an annual average of 41 million bushels. Next in order came Italy with 35 million, and the Low Countries with 35 million. Other sizable outlets during the period included Greece, the United Kingdom, and Austria. The Latin American countries, as a group, as well as parts of Asia, traditionally important markets, also continued to take substantial quantities.

The position of the United States as a leading exporter of wheat during the postwar period was made possible by the ability of our wheat farmers to produce--aided by generally favorable weather and the incentives of the domestic price support program. It was also made possible, of course, by the high level of world import requirements, and by the willingness of the United States to assume supply responsibility for many of these requirements through various foreign aid programs. Approximately 55 percent of the total United States exports of wheat, including flour during the 7-year period after World War II were financed by aid programs.

World Trade In 1953-54 May be Down by About 10 Percent;
World Production Large

Total world trade in wheat and flour during 1953-54, based on current indications, may be about 10 percent lower than the total of approximately 925 million bushels for 1952-53. There has been complete recovery in production (and in the supply position) of most countries compared with the earlier postwar period. [The 1953 world wheat crop is estimated to be only 4 percent below the record 1952 harvest of 7.3 billion bushels. The decline from a year ago is accounted for mainly by smaller crops harvested in the United States and Canada, and expected in the Southern Hemisphere--principally Australia and Argentina. The 1953 wheat crop of nearly 1.3 billion bushels in Western Europe--the main deficit area--is above a year ago, and exceeds the 1945-49 postwar average by about 325 million bushels. 5/

5/ For a complete statement on the 1953 breadgrain crop see "Foreign Crops and Markets," September 28, issued by Foreign Agricultural Service, USDA.

Supplies of wheat available for export or carryover in the principal exporting countries at the beginning of the 1953-54 marketing season totaled nearly 1.2 billion bushels--about double the level of July 1, 1952. Adding 1953 production in North America, total supplies in the United States in 1953-54 will be a record, and those in Canada of near-record proportions.

Supplies of wheat available for export in countries other than the so-called "big 4" are also at the highest level since before World War II. Turkey and France have record and near-record crops; French North Africa, the Middle East, and Sweden will have surplus supplies for export. The U.S.S.R. and Danube Basin countries have been contributing about 35 to 50 million bushels to the annual total of world wheat trade in recent years.

United States Exports in 1953-54 Are Running Below Year Earlier

United States exports in 1953-54 will decline as a result of the generally abundant supplies in both exporting and importing areas. For the 1952-53 season, U. S. exports totaled about 317 million bushels. For the first 5 months of 1953-54 exports are at the annual rate of about 215 million bushels.

There are, of course, some factors - unknown at present - that will have a bearing on total exports for the year. For example, the final outcome of December-January harvests in the Southern Hemisphere will influence the overseas demand for United States wheat. Production prospects for the Northern Hemisphere in the spring of 1954 also will have an important bearing on the total. Furthermore, the effects of Section 550 of Mutual Security Act of 1953 in increasing United States wheat exports are not definitely known at this time. This program provides for between \$100,000,000 and \$250,000,000 worth of United States surplus agricultural commodities to be sold overseas for foreign currencies. It also provides, among other things, that such sales do not displace, or substitute for, usual marketings of the United States and friendly countries.

Wheat and flour are included in the list of commodities eligible for purchase with foreign currencies under Section 550. However, considering the limitations under the Act, and the size of the appropriation, it would seem that wheat and flour exports under Section 550 will not be very large.

The Long-Term Outlook for United States Exports

It seems reasonable to expect that our wheat exports can be maintained in a range of 200 to 300 million bushels during the next few years. This is based on the assumption of a substantially higher level of world import requirements than before the war. Some of the reasons back of this assumption have already been mentioned. It is also based on the assumption that exports of wheat from countries other than the United States would continue to follow a fairly well established pattern. The usual qualification is made that there be no worsening of the present international situation.

But more important than any of these, perhaps, is the assumption that United States exporters of wheat and flour would have some means of bridging the price gap and competing effectively whenever domestic price support programs hold prices in the United States above those prevailing in world markets. It is suggested here that whether United States exports average towards the upper or lower limits of the 200-300 million-bushel range will depend in large part on the solution of this problem. This is not to imply that these limits are rigid. Exports could exceed 300 million bushels, but more easily could they fall below 200 million.

In earlier postwar years the U. S. depended on foreign aid programs, and more recently on the International Wheat Agreement to move the bulk of the wheat and flour exports. The renewed wheat agreement is not a completely satisfactory outlet. As originally negotiated, the U. S. quota under the renewed agreement was 270 million bushels. Largely as the result of the withdrawal of the United Kingdom from the pact, the U. S. quota has been reduced to 210 million bushels.

In an effort to expand wheat exports outside I.W.A., the Department announced on November 19, effective immediately, that the CCC is offering to sell to the regular export trade a limited quantity of CCC-owned wheat for export. This would be in addition to wheat moving under the Agreement program. Prices f.o.b., specified ports, will be announced at the same time each day that Agreement prices are announced by the USDA. The price per bushel will not be less than the Wheat Agreement price. CCC wheat also will be made available for export as flour.

THE RICE SITUATION AND OUTLOOK

BACKGROUND.- The acreage seeded to rice in the United States in 1953 totaled 2.20 million acres and the production of rough rice is currently estimated at 52.85 million cwt.--both all time records (table 15). During 1948-52 the acreage seeded to rice averaged 1.87 million acres and the production averaged 42.50 million cwt. In this period an average of 24.08 million cwt. was used by the United States, including Territorial use, for food, feed, seed, and by breweries.

The 1953 crop is two and a third times as much as the 1935-39 average of 22.43 million cwt. Production in the United States was increased when exports from Asia were cut off by the war and has been increasing ever since. World trade has been only partly restored, with gross exports in calendar 1952 only about 55 percent of prewar. The increase in United States production is not very significant in relation to the world total, since the United States produces only 1.5 percent of the total. However, from the standpoint of trade, United States rice exports in 1952 were about 16 percent of the total, compared with about 1 percent in 1936-40. This is the result of over a 7-fold increase in United States exports and the sharp drop in world trade.

Rice is one of the world's most important food grains, exceeded only by wheat, and normally has provided about one-fifth of the world's food supply. World rice production in 1953, estimated at 359 billion pounds, was about 85 percent as large as the world wheat production, estimated at 422 billion pounds. While about 92 percent of the world supply of rice is still produced in Asia (compared with 96 percent before the war), non-Asiatic countries have doubled their production. United States production rose to 230 percent of the 1935-39 average, while other non-Asiatic countries almost doubled their production.

Rice Prices Above Support

Prices received by farmers for rough rice averaged \$5.28 per cwt. in mid-November, compared with \$5.40 a month earlier and \$6.09 a year earlier. The 1953-crop loan is \$4.84. The price received for the 1952 crop averaged \$5.86, which was 16 percent above the 1952-crop loan of \$5.04, reflecting a very large export demand for the record large production. United States No. 2 Zenith at New Orleans for October averaged \$9.20 per cwt., milled, compared with \$10.55 a year earlier, and United States No. 2 California Pearl at San Francisco for the same month this year was \$9.00, milled, compared with \$9.80 a year earlier. Prices in these markets and prices received by farmers are shown in table 16.

Rice prices this year have been above support because of early season strong demand. With rice prices above support levels this year, only a small quantity of the 1953 crop has been placed under the support programs. Up to October 15 only 283,000 cwt. were so pledged, compared with 29,000 cwt. on October 15, 1952, when prices were also above support. Whether prices will continue at current levels depends largely on export demand.

U. S. Rice Supplies at Record Level: Continued Large Exports Needed to Avoid Large Carryover

United States rice supplies for the 1953-54 marketing year, in terms of milled rice, excluding brewers' rice, total 35.3 million cwt. (table 1). This exceeds the previous record of 33.2 million in 1951-52 by 6 percent. Old crop stocks at the beginning of the marketing year (August 1 in the South and October 1 in California) were the equivalent of 0.5 million cwt., and production the equivalent of 34.8 cwt. ^{6/} United States civilian consumption per person in 1952-53 was 6.0 pounds which was above the average of 5.1 pounds, in the previous 5 years. If we assume that food use will be at the rate of 5.8 pounds per person in 1953-54, the total would be 9.3 million cwt. Moreover, if other uses, including domestic (seed, feed, and brokens), shipments to Territories, and military procurement, total 7.3 million cwt., the quantity available for exports and carryover would be 18.7 million cwt., compared with 13.3 million for 1952-53 and 14.9 for 1951-52. Unless our exports are again at record levels, we will not be able to avoid a substantial increase in carryover stocks. Exports August through September totaled 1.70 million cwt. this year compared with 1.60 million a year earlier.

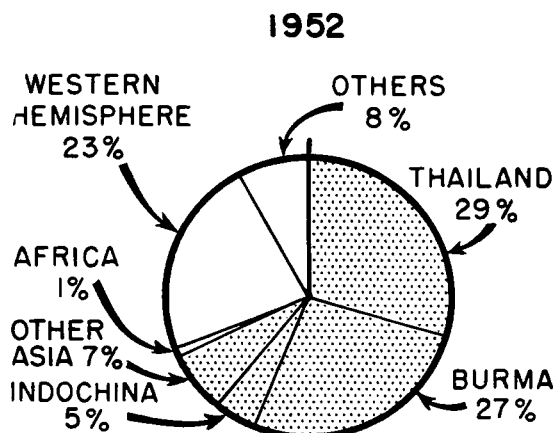

^{6/} Estimates for November for States of Texas, Louisiana, California, Arkansas, and Mississippi, plus an allowance for minor States of Missouri, South Carolina, Arizona, and Florida.

RICE: WORLD TRADE

EXPORTS

8.6 MILLION SHORT TONS

5.4 MILLION SHORT TONS

IMPORTS

8.1 MILLION SHORT TONS

5.4 MILLION SHORT TONS

U.S.D.A.

FAS-NEG. 120

World rice exports in 1952 were about 60 percent of the 1936-40 period. Rice shipments from Korea and Taiwan to Japan before the war accounted for as much as 20 percent of the world trade in rice, but in 1952 the imports of those two countries exceeded the exports.

Rice exports of Asia in 1952 comprised about 68 percent of the world trade compared with 93 percent in 1936-40. The principal increase in exports outside of Asia occurred in the Western Hemisphere, where the surplus countries more than trebled their trade in rice.

Exports from the United States increased from 2.4 million cwt. milled rice in 1936-40 to 17.0 million cwt. in 1952, or more than a seven-fold increase. This made the United States the third largest exporter, exceeded only by Thailand and Burma.

Japan in 1952 was the largest rice importer, followed by India, Indonesia, Malaya, Ceylon, Cuba, and Hong Kong. The United States was the principal supplier for Cuba, Korea, Japan, and Indonesia. Other sources included Egypt, Brazil, Italy, Australia, and the Belgian Congo.

Table 1.- Rice, milled basis, excluding brewers' rice: Supply and distribution, continental United States, 1934-53 1/

1953										

Data from U. S. D. A. Production and Marketing Administration, Department of Commerce, Department of National Defense, as well as from the Bureau of Agricultural Economics.

1/ Unmilled rice is converted on the basis of pounds of milled rice (heads, second heads, and screenings, excluding brewers', produced annually from 100 pounds of rough rice, converted separately for Southern States and for California. For the 5 years ended July 1952, 100 pounds of rough rice produced an average of 65.6 pounds of such milled rice.

2/ Supply and domestic distribution includes California on an October 1 year.

3/ Stocks on farms, in country warehouses, and in mills, and in addition includes U. S. D. A. holdings outside of mills, in million bags as follows: 1.06 in 1943, 1.79 in 1944, 0.25 in 1945, 0.37 in 1946, 0.16 in 1947, 0.01 in 1948, 0 in 1949, 0.12 in 1950, 0.03 in 1951, 0 in 1952, and 0 in 1953. Stocks are old crop on hand August 1 in Southern States and October 1 in California.

4/ Civilian food disappearance of commercially milled rice produced from domestic grain plus rice used on farms where grown and by custom mills for local consumption, adjusted for military procurement and use of broken rice by brewers. Thus, consumption data represent the year rice enters trade channels rather than the time of actual human consumption. In some years large stocks are held by wholesalers and retailers, while in other years these stocks are small.

5/ Rice used by brewers other than brewers' rice as such, which is not included in this table.

6/ Preliminary.

7/ Excludes imports.

8/ Prior to 1941 exports and shipments are on marketing-year basis (August-July for Southern States and October-September for California). Beginning with 1941, exports and shipments are on a July year; complete figures are available for such a year, whereas they are not for an August year.

9/ Includes exports of rough rice in terms of milled equivalents.

10/ Excludes shipments by military for civilian relief feeding.

11/ Procured for both civilian relief feeding and for military food use; military takings for civilian feeding in occupied areas measured at time of procurement, not at time of shipment overseas.

12/ Balancing item results for drying loss, waste, differences arising from the use of July-year exports and shipments, and error in data and conversion.

Table 1 shows rice supply and distribution, in terms of milled rice, beginning in 1934. This table includes heads, second heads and screenings, but excludes brewers' rice, and shows the carryover of old rice at the time the new crop comes on the market, which is August 1 in the South and October 1 in California. It also shows the breakdown between commercial, military, and USDA exports and shipments. 7/

Rice Outlook Centers Around Exports

The United States rice outlook centers around the answer to the question of how much rice can we export. There is no definite answer possible at this time, for the years ahead or even for the current year. Earlier this year we had export quotas, largely to assure that military supplies would be available. However, with the turn of events in Korea these requirements were sharply reduced and export controls were removed.

Export demand for 1953-54 depends largely upon purchases by Japan, which together with Cuba and Korea constituted our largest takers in 1952-53. While Japan this year had the lowest rice production in a number of years, due to typhoon damage and unfavorable weather throughout the growing season, the quantity of rice which the United States exports to that country will depend to a large extent on the rice price levels in the next 3 months. If United States prices of export grades remain reasonably competitive with prices of similar quality in Southeast Asia, especially in Burma and Thailand, we may be able to end the marketing year with a carryover only moderately larger than the 1.5 million cwt., rough rice basis, on hand August 1, 1953. However, if our competitive position is not maintained, the Japanese Government will be forced to maximize purchases from other areas at more favorable prices.

According to a cable from D. V. Rivenburgh, Marketing Specialist, U. S. Foreign Agricultural Service, Tokyo on November 3, 1953, "There are considerable stocks of rice outside the United States which have not been moving in world export during 1953 because of unusually low quality. There is now some evidence of price concessions on the part of such stocks amounting to as much as \$30 to \$50 a ton. Should United States prices of the export-grade rise appreciably above October levels, then the shift of purchase to other sources would become an economic necessity for Japan."

Export Demand Outlook

The export outlook for 1954-55 and beyond also is uncertain. Cuba has been the only dependable foreign outlet for United States rice. Out of a total of 17.4 million cwt. of milled rice exported in the last marketing year (August-July), 4.9 million cwt. went to that country. Exports to Korea

7/ Table 14, which is the basis for **allotment determination**, shows the supply and distribution, both on a rough and milled basis, 1947-51 average, and annual 1951-52 and 1952-53. This table includes brewers' rice as well as other millings and is entirely on an August 1 year. This means that stocks in California are larger than they are on October 1, the beginning of the new marketing year for that State, by the amount of domestic disappearance, exports, and shipments in August and September.

totalled 4.5 million cwt. and exports to Japan 4.4 million cwt. Exports to all other countries in 1952-53 totalled only 3.6 million cwt. (table 18). Exports to Japan and Korea were relatively unimportant prior to 1951. Korea is historically a rice exporting country and, if the situation in that country permits, it may again become an exporting country. In the current year imports into Korea may be less than a fourth of what they were a year ago.

Imports of United States rice by Japan will continue in large volume only if the price of United States rice is relatively competitive with the price of rice in other exporting countries or the price of other grains, and economic conditions make purchases possible. In recent years, prices of U. S. rice have been competitive with those of Burma and Thailand, the two principal exporters.

The importance of U. S. export market is emphasized by comparing it with the quantity we use for food in the United States. In 1952-53 our record exports of 17 million cwt. of milled rice were almost twice as much as the approximately 9.2 million cwt. used as table rice in the United States.

Announcement Regarding Acreage Allotments
and Marketing Quotas Must be Made
Before December 31

Announcement regarding acreage allotments and marketing quotas for the 1954 crop must be made before December 31. No determination has yet been made because of the uncertainty concerning the size of our exports during the current marketing year, which in turn will affect the size of our carryover August 1, 1954. It would appear that marketing quotas will not be necessary but that acreage allotments may be proclaimed. Price support for the 1954 crop to growers who cooperate with the program is mandatory at 90 percent of parity at the beginning of the marketing year.

WORLD RICE CROP PROSPECTS FAVORABLE 8/

World rice production in 1953-54 (August-July) may be slightly larger than in the year before, according to the first estimate of the Foreign Agricultural Service. Rice acreages were extended in many areas of the world, and in most of the countries larger crops than last year are either being harvested or are in prospect.

The 1953-54 world harvest of rough rice is forecast at 359 billion pounds as compared with 357 billion pounds in the preceding year, and with the average of 335 billion pounds in the prewar average (1935-36/39-40) period. Increased production is indicated for all Continents. Larger acreages were sown in all regions except Europe, where the decline in acreage was more than offset by increased yields per acre.

8/ From Foreign Crops and Markets, November 16, 1953, published by Foreign Agricultural Service, USDA.

Northern Hemisphere: Harvesting of bumper crops is now in progress in some countries of the Northern Hemisphere, while in others the outturn is below normal. Substantial gains occurred in the rice acreage of North America, notably the United States and Cuba, where larger crops are being harvested. The forecast of rice acreage in Cuba shows a pronounced increase, and with continued good weather, the crop will be about 375 million pounds, rough rice basis, compared with 277 million in 1952. Rice acreage increases were planned also in Central America, but production in some countries was retarded by unseasonal weather.

Italy and Spain are harvesting larger crops from increased acreages. Producers of France and Greece were unable to plant all the intended acreages because of unfavorable weather, but improved conditions in later months resulted in larger crops than in the preceding year. Shortage of water for irrigation in Portugal also prevented some acreage intended for rice from being sown, and continued dry weather caused a reduction in per-acre yields as compared with a year earlier.

Egypt's production is expected to show a moderate increase. Permits were granted for a larger rice acreage than in 1952, but water supplies were not adequate to permit a return to the large rice area of the 1945-49 post-war period. Iran and Iraq increased the acreage in rice, and 1953 crops are expected to be among the largest on record. Turkey's rice crop is expected to be as large as last year's record outturn.

Nearly all the available rice area of South Korea was planted this year, generally good weather has prevailed through the season, and the current harvest is reported to be one of the best in history.

On the other hand, the 1953 rice crop of Japan is the smallest in many years. Substantial crop losses were sustained in the typhoons and floods of late June and August. In addition to that, cool weather delayed transplanting, and continued to retard growth throughout the growing season. Prolonged periods of cool, cloudy weather, when sunshine was essential for growth, prevented a large part of the crop from maturing normally.

Although statistics for the 1953 rice harvest of China have not been reported, indications point to a decrease below last year's outturn because of unfavorable weather.

Main rice crop of southern Asia: Increased production is in prospect for other countries of the Far East, where the crop will be harvested mainly in December. These include Burma, India, Indochina, Malaya, Pakistan, the Philippine Republic, and Thailand. Production is expected to increase also in Taiwan (Formosa) and Ceylon, where 2 crops a year are harvested. Acreages and production of the crops harvested in these countries in late 1953 are larger than a year ago, and indications point to further increases in the first crops of 1954. Indonesia plans to increase rice acreage to be planted mainly in February.

Southern Hemisphere: Rice acreages are continuing to be expanded in the countries of South America, notably Colombia and Venezuela. Brazil's rice acreage is expected to show an increase because of the current scarcity and high price of rice. Since rice in the southern areas of South America is only now being planted, it is too early to appraise crop prospects, except to apply average yields per acre to areas reported planted.

Surplus countries: Without exception, larger rice crops are being or are expected to be, harvested in all countries that usually have surpluses for export, and also in some that have rice for export only from time to time. The total increase over 1952-53 production in these countries is estimated at 7,000 million pounds (2,450,000 short tons in terms of milled rice).

The largest gain in production in these surplus countries is in the "rice bowl" of Asia - Burma, Indochina, and Thailand--where total production is estimated at 44,700 million pounds of rough rice, an increase of 4,200 million pounds (1,470,000 short tons in terms of milled) from the 40,500 million pounds of a year earlier.

Burma increased rice acreage by about 500,000 acres, and above-average yields per acre are expected to be harvested. Rice acreage was extended substantially also in Cambodia and South Viet Nam. Drought in Cambodia, however, reduced considerably the total production of that country. Dry weather in South Viet Nam decreased the output to some extent, but production is expected to exceed that of last year because of the large increase in acreage planted. Prospects in Thailand are for a bumper crop in 1953-54.

Gains in production are expected in other surplus countries (in order of volume) in Pakistan, Brazil, South Korea, United States, Egypt, Spain, Colombia, and Italy. It is too early in the season to have production estimates of Taiwan (Formosa), Ecuador, British Guiana, Uruguay, Argentina, Australia, and Madagascar; however, if normal weather results in the production of average yields per acre, these countries also will have surpluses larger than those obtained from the 1952-53 production.

- 19 -

1/ Includes flour and products in terms of wheat.

2/ Prior to 1937 some new wheat included; beginning with 1937 only old-crop wheat is shown in all stocks positions. The figure for July 1, 1937, including the new wheat, is 102.8 million bushels, which is used as year-end carryover in the 1936-37 marketing year.

3/ Imports include full-duty wheat, wheat imported for feed, and dutiable flour in terms of wheat. They exclude wheat imported for milling in bond and export as flour, also flour free for export.

4/ Includes procurement for both civilian relief feeding and for military food use; military takings for civilian feeding in occupied areas measured at time of procurement, not at time of shipment overseas.

5/ Exports as here used, in addition to commercial exports, include U.S.D.A. flour procurement rather than deliveries for export. Beginning with 1941-42, deliveries for export (actual exports, including those for civilian feeding in occupied areas) of wheat, flour, and other products, in million bushels, were as follows: 27.9; 27.8; 42.6; 144.4; 390.6; 397.4; 485.9; 504.0; 299.1; 366.1; 1951-52, 475.3; and for 1952-53, 317.2.

6/ To Alaska, Hawaii, Puerto Rico, Guam, Samoa, Virgin Islands, and Wake Island; partly estimated.

7/ Preliminary.

Table 3 .- Wheat: Supply and disappearance, United States, July-December and January-June periods, 1942-53 1/

1/ Exports exclude shipments by military for civilian feeding, and exports of flour from foreign wheat milled in bond.
 2/ U. S. wheat and flour used with foreign wheat in milling in bond for export.
 3/ USDA flour procurement rather than deliveries for export; the latter, total exports including wheat and other products, are given in table 2, footnote 5.
 4/ Shipments, partly estimated, are to Alaska, Hawaii, Puerto Rico, Guam, Samoa, Virgin Islands and Wake Island.
 5/ Includes procurement for both civilian relief feeding and for military food use; military takings for civilian feeding in occupied areas measured at time of procurement and not at time of shipment overseas.

1/ Includes flour expressed in wheat equivalent. Exports of wheat products other than flour, not shown in the table, expressed in thousand bushels, wheat equivalent, beginning with 1941-42, were as follows: 326; 1,265; 2,347; 2,464; 2,213; 3,441; 7,095; 1,437; 649; 572; and 535

2/ As reported by the Department of Commerce. 3/ Classified as "unfit for human consumption" or imported for special feeding programs. 4/ Includes some flour imported free for export, which for 1939 was 214,000 bushels; 1940, 170,000 bushels; 1941, 2,000 bushels; 1942, 2,000 bushels; 1945, 19,000 bushels; 1948, 1,000 bushels; and 1949, 29,000 bushels. 5/ Includes wheat and wheat products used for livestock and poultry feed, imported duty-free by the Commodity Credit Corporation. 6/ From the National Military Establishments; financed by the United States. 7/ Mostly from imported wheat, but an average of 283,000 bushels annually of U. S. wheat was also used in the 1941-50 period. 8/ 14,072,000 reported by the Department of Commerce plus 822,000 unreported exports to British Services. 9/ 142,637,000 reported by the Department of Commerce plus 11,358,000 unreported January-June 1947 exports to Germany financed by the United Kingdom. 10/ 154,407,000 reported by the Department of Commerce plus 11,884,000 unreported January-June 1947 exports to Germany financed by the United Kingdom. 11/ 184,324,000 reported by the Department of Commerce plus 23,038,000 exports to Germany financed by the United Kingdom. 12/ 123,546,000 reported by the Department of Commerce plus 9,539,000 exports to Germany financed by the United Kingdom.

1/ 1929-1940 in the Wheat Situation, September 1943, page 12.

2/ Subject to revision.

3/ Includes grain equivalent of flour made from U. S. wheat; and semolina and macaroni (in terms of wheat) for years beginning July, in million bushels, as follows: 1942, 1; 1943, 1; 1944, 2; 1945, 1; 1946, 3; 1947, 6; and 1948, 1; other years less than 1. Also, includes shipments to territories of the United States.

Note.- Figures in this table are not based on survey nor enumeration data and are therefore only approximations. Estimated stocks on farms and in interior mills, elevators, and warehouses by kinds, are assumed to be present in about the same proportion as produced; the classes within kinds are established on the basis of the quinquennial wheat-variety surveys. Commercial stocks are reported by classes, and merchant mill stocks are broken down largely on the basis of the distribution by classes of commercial stocks, after making allowance for quantities going for export. Exports and shipments by classes are estimated on the basis of "inspection for export" for wheat as grain, and on the basis of the area from which exports are made for flour; also, on the basis of records of the former War Food Administration and the Department of Agriculture, and export indemnifying agencies.

^{1/} Consumption determined by adding production and imports of flour and deducting (in terms of flour) exports, shipments, and military procurement of flour and other products (semolina, macaroni, and similar products, and bakery products), and breakfast food produced in the flour milling industry. For further details on method of flour consumption determination see The Wheat Situation, July-August 1950, pages 11-15. ^{2/} Using commercial production reported by Bureau of the Census. From 1940-44 estimates were developed in cooperation with BAE.

^{3/} Based on population data which are adjusted for underenumeration of all age groups. ^{4/} Includes estimates of non-commercial production reported by BAE as farm wheat ground for flour or exchanged for flour. ^{5/} 100 pounds.

1/ Stocks on August 1, 1951 include the equivalent of approximately 2 million cwt. of rough rice sold for export but not lifted prior to July 31, 1951. 2/ Includes minor States of Missouri, South Carolina, Arizona and Florida. 3/ Consists mainly of broken rice. 4/ Adjusted to accommodate disappearance as accounted for. Compensates for losses and possible errors in estimates of production, stocks, or utilization as derived from reported data. 5/ Includes shipments to territories and military food use. 6/ Includes broken rice used by brewers as well as brewers' rice.

Data on imports and exports from Bureau of Census. Brewers' use of rice from Internal Revenue Service. Food use and stocks calculated in part from reports of the Rice Millers' Association, New Orleans, Louisiana, and from Grain Division, AMS.

1/ U. S. monthly prices are the result of weighting monthly State prices by production. U. S. marketing-year prices are the result of (1) weighting State monthly prices by monthly sales to obtain State marketing-year averages, and (2) weighting the State marketing-year averages by total sales for each State. 2/ Preliminary. 3/ Data from Grain Division, AMS.

RICE (rough): Acreage, yield per acre, and production in specified countries, averages 1935-36/39-40 and 1945-46/49-50, annual 1951-52 to 1953-54 1/

1/ Crops harvested in Northern Hemisphere countries during the latter part of the year, together with those harvested in Asia principally from November to May, are combined with crops harvested in Southern Hemisphere countries during the first part of the following year. 2/ Preliminary. 3/ Average 1931-37. 4/ Comparable data not available. 5/ The area formerly known as French Indochina is now comprised of the Kingdom of Laos, the Kingdom of Cambodia, and the State of Vietnam. 6/ Average 1936-37 to 1939-40. 7/ Korea. In the 1935-39 period, production in South Korea averaged about 6,750 million pounds annually.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, reports of U.S. Foreign Service officers, results of office research, and other information.
